

PROPERTY INTELLIGENCE REPORT

**PRELIMINARY PROPERTY
ASSESSMENT**

123 Main Street
Marlboro Township, New
Jersey 07746

Prepared for: Sample Client
Report Date: August 7, 2026
Report ID:
ATLAS-2026-0807-001

PROPERTY INTELLIGENCE

A plain-English preliminary assessment combining property, zoning, flood, environmental and engineering information. This sample illustrates the intended final-report experience.

ZONING

R-20

FLOOD

AE / Partial

WETLANDS

Possible

BUILDABILITY

72 / 100

EXECUTIVE FINDING

Preliminary conclusion: The sample property appears generally compatible with low-density residential use. Several common improvements may be feasible, but mapped flood conditions and potential environmental constraints warrant verification before design or construction.

WHAT THIS REPORT ANSWERS

- What is this property?
- What zoning appears to apply?
- What major constraints should I know about?
- What improvements may be possible?
- What should I verify next?

IMPORTANT: Automated preliminary assessment only. Not a survey, zoning opinion, legal opinion, or certified engineering determination.

01 | PROPERTY OVERVIEW

A concise snapshot of the property and the information used in this assessment.

Property	123 Main Street	Municipality	Marlboro Township
County	Monmouth County	State	New Jersey
Block / Lot	34029 / 12	Approx. Lot Area	20,000 sq. ft.
Coordinates	40.3154, -74.2467	Property Use	Residential

KEY FINDINGS

AREA	STATUS	WHAT IT MEANS
Zoning	R-20	Low-density residential district; verify dimensional requirements for the proposed improvement.
Flood	Attention	A mapped flood hazard area may affect portions of the site and could trigger additional review.
Wetlands	Verify	Potential mapped wetlands are an important siting constraint; field verification may be needed.
Development	Potential	Several common residential improvements may be feasible subject to setbacks, coverage and permits.

SOURCE & CONFIDENCE

The production version will show source agencies, retrieval dates, data freshness, source links where appropriate, and confidence/verification status for major findings.

02 | ZONING & DEVELOPMENT STANDARDS

Technical zoning information translated into practical implications.

Requirement	Illustrative Requirement	Existing / Assessment	Status
Minimum Lot Area	20,000 sq. ft.	20,000 sq. ft.	Meets
Minimum Lot Width	100 ft.	125 ft.	Meets
Front Yard Setback	50 ft.	≈75 ft.	Meets*
Side Yard Setback	15 ft.	≈20 ft.	Meets*
Rear Yard Setback	35 ft.	≈60 ft.	Meets*
Maximum Lot Coverage	20%	≈12%	Within
Maximum Impervious	20%	≈18%	Near limit

*Illustrative conditions only; field/survey verification is required.

PLAIN-ENGLISH INTERPRETATION

The property appears to have dimensional characteristics that could support several typical residential improvements. The illustrative impervious-area estimate is relatively close to the maximum, so a proposed addition, pool, driveway expansion or other improvement should be evaluated together as part of the site plan.

QUESTIONS TO ANSWER FOR THE USER'S PROJECT

- Is the proposed improvement permitted?
- Can it fit while maintaining setbacks?
- Will it increase impervious coverage?
- Will grading, drainage or stormwater review be triggered?
- Are environmental or flood constraints involved?

03 | FLOOD & ENVIRONMENTAL REVIEW

Constraints are presented with a clear distinction between mapped information and professional verification.

FEMA Flood Zone	AE — Partial Intersection
Special Flood Hazard Area	Portion of parcel appears mapped within the area
Implication	Floodplain requirements may apply depending on the proposed work and exact limits.
Recommended Action	Verify flood zone/elevation conditions before design decisions.

ENVIRONMENTAL CONSTRAINTS

Potential wetlands: Mapping suggests a possible environmental constraint. Mapped presence does not establish the legal boundary of wetlands. A qualified professional should verify limits and determine whether NJDEP or other approvals may apply.

ENGINEERING INTERPRETATION

Flood and environmental findings do not automatically mean development is impossible. They mean that the location, type and extent of proposed work matter. The production system will use the user's selected project goal to focus the analysis.

VERIFICATION FLAGS

●	Flood limits	Professional verification recommended
●	Wetland limits	Professional / field verification recommended
●	Impervious coverage	Confirm with survey/site plan
●	Municipal requirements	Verify current ordinance and application requirements

04 | WHAT MAY BE POSSIBLE

The report should move from raw property data to practical decisions.

Potential Improvement	Preliminary Signal	Why / What to Verify
Swimming Pool	Likely feasible	Setbacks, impervious coverage, floodplain and environmental constraints.
Addition	Potentially feasible	Setbacks, lot coverage, impervious coverage, building and zoning requirements.
Detached Garage	Potentially feasible	Accessory-structure standards, setbacks, coverage and access.
Patio / Deck	Potentially feasible	Coverage, setbacks, flood/environmental constraints and permits.
Driveway Expansion	Needs review	Impervious coverage, drainage, access and municipal requirements.

RECOMMENDED NEXT STEPS

1	Confirm the intended project	Tell MIDRA what you want to build or change.
2	Review mapped constraints	Confirm flood/environmental information relevant to the project.
3	Verify site conditions	Obtain or use a current survey/site plan where needed.
4	Check municipal pathway	Confirm applicable zoning, permits and approvals.
5	Request engineering review	Use MIDRA Engineering for professional verification when appropriate.

MIDRA ENGINEERING

Professional engineering review available upon request.
The production report will provide the appropriate review-request and document workflow.

05 | REPORT NOTES & DISCLAIMER

The final product must be useful without overstating certainty.

DISCLAIMER

This report is generated from publicly available information and automated analysis. It is provided for informational purposes only and does not constitute an official engineering determination, survey, zoning opinion, legal advice, or a guarantee of development approval. Property conditions, municipal ordinances, regulatory requirements, mapping and source data may change. All findings should be verified before relying on them for design, permitting, financing, purchase, construction or other decisions.

AUTOMATED VS. PROFESSIONAL REVIEW

MIDRA Intelligence provides preliminary property intelligence. A licensed engineer remains responsible for professional engineering conclusions, where applicable. The professional workflow can convert an automated report into an engineer-reviewed deliverable, with signed and sealed documents only where appropriate and legally permitted.

REPORT DATA TRANSPARENCY

The production version will identify major data sources, retrieval dates, confidence indicators and verification flags. When information is uncertain, MIDRA should say so rather than infer an unsupported conclusion.

PRELIMINARY PROPERTY INTELLIGENCE	ENGINEER-REVIEWED REPORT
Automated analysis Public/authoritative data Plain-English interpretation Decision support	Licensed professional review Professional comments Official engineering conclusions where applicable Signed/sealed where appropriate

END OF SAMPLE REPORT

This PDF is a visual/structural example of the intended MIDRA Property Intelligence Report.
